Description

Great plugin, but as a noob I'm struggling to achieve the following:

w've got a custom field (option field, select2 to have search capability) called "IT-Service"; based on changing the IT-Service, we would like to change/suggest an assignee (which can be overriden manually).

My idea so far: create a hash array, mapping IT-Services to users;

Would you see the Hooks Manager as an appropriate solution for this scenario?

Thanks a lot in advance for your input!
